a mathematical introduction to logic

john corcoran was a very well known logician who worked on several areas of logic he produced decisive works giving a better understanding of two major figures in the history of logic aristotle and boole corcoran had a close association with alfred tarski a prominent 20th century logician this collaboration manifested in corcoran s substantial introduction to tarski s seminal book logic semantics metamathematics 1956 additionally corcoran s posthumous editorial involvement in what are logical notions 1986 breathed new life into this seminal paper authored by tarski his scholarly pursuits extended to the intricate explication of fundamental concepts in modern logic including variables propositions truth consequences and categoricity corcoran s academic curiosity extended further to the intersection of ethics and logic reflecting his contemplation of their interrelation beyond these theoretical contributions corcoran was deeply engaged in the pedagogical dimensions of logic instruction this volume serves as a compilation of articles contributed by corcoran s students colleagues and international peers by encompassing a diverse range of subjects this collection aptly mirrors corcoran s wide ranging interests offering insights that not only deepen our understanding of his work but also advance the theoretical frameworks he explored

this volume is written jointly by witold marciszewski who contributed the introductory and the three subsequent chapters and roman murawski who is the author of the next ones those concerned with the 19th century and the modern inquiries into formalization algebraization and

mechanization of reasonings besides the authors there are other persons as well as institutions to whom the book owes its coming into being the study which resulted in this volume was carried out in the historical section of the research project logical systems and algorithms for automatic testing of reasoning 1986 1990 in which participated nine polish universities the project was coordinated by the department of logic methodology and philosophy of science of the białystok branch of the university of warsaw and supported by the ministry of education some of its results are reported in srzednicki ed 1987 the major part of the project was focussed on the software for computer aided theorem proving called mizar mse multi sorted first order logic with equality reported in marciszewski 1994a due to dr andrzej trybulec he and other colleagues deserve a grateful mention for a hands on experience and theoretical stimulants owed to their collaboration

this book offers a comprehensive account of logic that addresses fundamental issues concerning the nature and foundations of the discipline the authors claim that these foundations can not only be established without the need for strong metaphysical assumptions but also without hypostasizing logical forms as specific entities they present a systematic argument that the primary subject matter of logic is our linguistic interaction rather than our private reasoning and it is thus misleading to see logic as revealing the laws of thought in this sense fundamental logical laws are implicit to our language games and are thus more similar to social norms than to the laws of nature peregrin and svoboda also show that logical theories despite the fact that they rely on rules implicit to our actual linguistic practice firm up these rules and make them explicit by carefully scrutinizing the project of logical analysis the authors demonstrate that logical rules can be best seen as products of the so called reflective equilibrium they suggest that we can profit from viewing languages as inferential landscapes and logicians as geographers who map them and try to pave safe routes through them this book is an essential resource for scholars and researchers engaged with the foundations of logical theories and the philosophy of language

this book is an account of the important influence on the development of mathematical logic of charles s peirce and his student o h mitchell through the work of ernst schröder leopold löwenheim and thoralf skolem as far as we know this book is the first work delineating this line of influence on modern mathematical logic

for ease of use this edition has been divided into the following subject sections general principles materials and processes control power electronics and drives environment power generation transmission and distribution power systems sectors of electricity use new chapters and major revisions include industrial instrumentation digital control systems programmable controllers electronic power conversion environmental control hazardous area technology electromagnetic compatibility alternative energy sources alternating current generators electromagnetic transients power system planning reactive power plant and facts controllers electricity economics and trading power quality an essential source of techniques data and principles for all practising electrical engineers written by an international team of experts from engineering companies and universities includes a major new section on control systems plcs and microprocessors
